

REMIND Lab - Domain Model Specification

MVP v0.1 | Ubiquitous language, invariants and lifecycle

1. Purpose

Defines the current business model for the REMIND Lab MVP. It focuses on concepts, responsibilities, invariants and transitions rather than framework classes.

2. Domain overview

3. Ubiquitous language

Term	Definition
EmergencyReport	Occurrence reported by a User that requires coordination and may be assumed by an eligible Company.
User	Actor who reports an emergency and owns author-controlled actions.
Company	Organization configured to handle one or more emergency categories.
Admin	Administrative actor managing Users and Companies; this authority is distinct from lifecycle authority.
EmergencyCategory	Classification used to determine Company eligibility.
Severity	Current urgency, independent from lifecycle status.
Status	Position of the report in its response lifecycle.
ResponseReport	Information recorded by the responsible Company about the response; detailed structure pending.
Eligible Company	Company whose configured categories include the report category.
Assigned Company	Single Company that successfully assumed an OPEN report.

4. EmergencyReport invariants

- Creation requires title, description, location, category and severity.
- Every new report starts OPEN.
- Author is derived from the authenticated User.
- Title, description, location and category are immutable after creation in the current MVP.
- Severity may be changed by the author while OPEN or IN_PROGRESS.
- Only OPEN reports may be assumed; only eligible Companies may assume them.
- At most one Company may be assigned.
- Only the assigned Company may resolve an IN_PROGRESS report.
- Only the author may cancel while OPEN or IN_PROGRESS.
- RESOLVED and CANCELLED are terminal; reopening requires a new report.
- Cancellation preserves history and is not deletion.

5. Lifecycle and authority

Command	Source	Target	Authority	Rule
create	-	OPEN	User	Authenticated creator becomes author.
accept	OPEN	IN_PROGRESS	Company	Must handle category; only one succeeds.
changeSeverity	OPEN / IN_PROGRESS	unchanged	User	Must be author.
cancel	OPEN / IN_PROGRESS	CANCELLED	User	Must be author.
resolve	IN_PROGRESS	RESOLVED	Company	Must be assigned Company.

6. Deferred domain concepts

- No Team, Vehicle, Dispatch, Route, GPS, Notification, AI classifier, broker, cache or microservice in the current model.
- Subcategories wait until category routing proves insufficient.
- No dedicated lifecycle-history model is assumed yet.
- ResponseReport remains provisional until its business data is defined.

7. Open decisions

- Exact Severity enum and whether severity may decrease.
- Whether IN_PROGRESS cancellation requires a reason or acknowledgement.
- Required ResponseReport fields/cardinality.
- Administrative deletion/deactivation and retention semantics.
