

REMIND Lab - Problem, Scope & MVP

Version 0.1 | Initial domain definition

1. Problem Statement

REMIND is a platform for coordinating and responding to day-to-day emergency occurrences. A person reports an emergency, eligible organizations discover the occurrence according to the type of response they provide, one organization assumes responsibility, and the occurrence is followed until resolution or cancellation.

The MVP focuses on the coordination lifecycle. It does not attempt to automate emergency diagnosis, dispatch physical teams, or reproduce the complete operational systems used by public safety and healthcare institutions.

2. Engineering Principle

Earned complexity

Architectural complexity is introduced only in response to demonstrated requirements, measurable constraints, or concrete failures in the simpler solution. Technology is a consequence of a problem, not a portfolio checklist.

Every relevant technical decision should therefore answer a concrete question: what observable problem are we solving, what simpler alternatives exist, and why is the additional complexity justified?

3. MVP Goal

Validate the core workflow: a user can report an emergency; companies capable of handling its category can discover it; one eligible company can assume it; the occurrence can progress through its lifecycle; and both sides retain a meaningful history.

4. Explicitly Out of Scope

- AI or LLM integrations.
- Kafka or other distributed message brokers.
- Redis or distributed caching.
- Microservices. The MVP starts as a monolith.
- Automatic geolocation-based dispatch or routing.
- Physical team, vehicle, fleet, or resource dispatch management.
- Automatic emergency classification or severity assessment.
- Subcategories unless a concrete routing problem demonstrates their necessity.

5. Initial Success Boundary

The MVP is successful when the complete emergency-report lifecycle can be executed consistently while enforcing its business rules. Performance optimization, distributed infrastructure, automation, and advanced dispatch are intentionally deferred.
