

REMIND Lab - Domain & Actors

Version 0.1 | Ubiquitous language and initial domain boundaries

1. Actors

Actor	Responsibility
User	Creates and follows emergency reports; manages own profile; can update severity and cancel reports according to lifecycle rules.
Company	Represents an organization capable of responding to one or more emergency categories; discovers eligible reports, assumes occurrences, conducts response, resolves occurrences, and records response information.
Admin	Manages users and companies. Administrative capabilities do not automatically imply permission to bypass domain history or physically delete emergency records.

2. Core Domain Concepts

EmergencyReport. The central record of an emergency reported by a User. It represents the occurrence and its coordination state.

Company. An organization registered to respond to one or more categories of emergency.

EmergencyCategory. Classification used to route reports to compatible companies. The MVP begins with four categories: **MEDICAL**, **FIRE**, **CRIME**, and **ACCIDENT**.

Severity. Represents the current urgency of the occurrence. It is independent from lifecycle status and may change while the real-world situation evolves.

ResponseReport. Concept for information recorded by the responsible Company about the completed response. Its exact structure remains intentionally open until its business requirements are defined.

3. Category Matching

The category describes the emergency, not the responder. Therefore the model uses CRIME rather than POLICE and MEDICAL rather than HOSPITAL.

A Company may handle multiple categories, and a category may be handled by multiple companies. For example, ACCIDENT may be relevant to medical, fire-response, or other eligible organizations.

Initial routing rule

A company can discover and attempt to assume only OPEN EmergencyReports whose category is included in the categories that company is authorized to handle.

4. Why No Subcategory Yet?

The MVP uses title and description to provide details inside a category. A subcategory will be introduced only if real routing ambiguity appears - for example, when companies repeatedly receive ACCIDENT reports they are not capable of handling. This preserves the earned-complexity rule.
